WEATHER SYNOPSIS BY REGION

NORTHERN CALIFORNIA

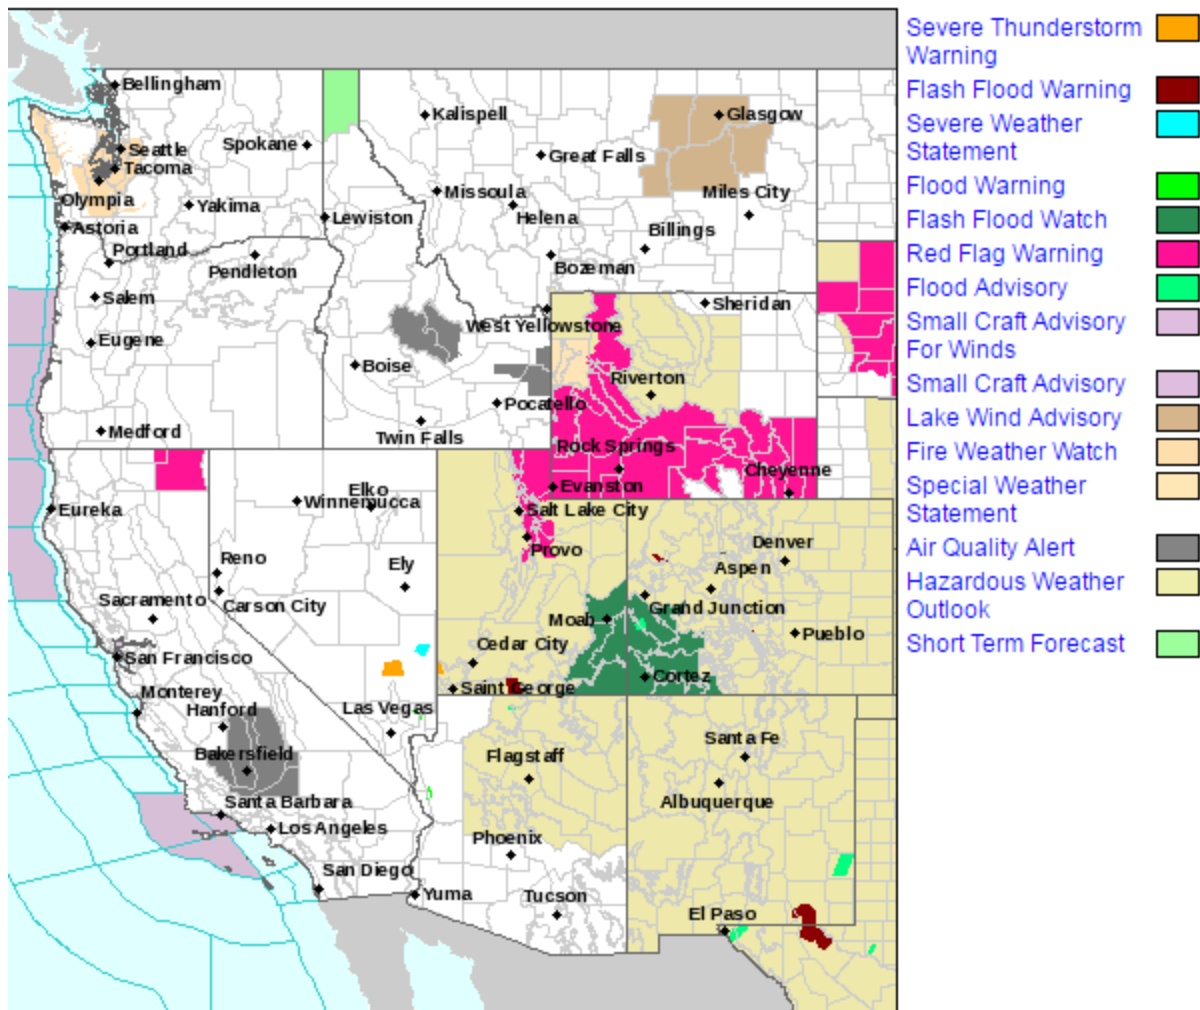

The low pressure trough responsible for the recent thunderstorm activity has moved off to the east. A high pressure ridge in the eastern Pacific will be the dominant weather feature for the region today. A dry northwest flow aloft will prevail today, although there is a chance of thunderstorms just to our southeast over the central Sierra and across central Nevada. Warm and dry conditions will prevail today, with temperatures 2-5 degrees above normal and humidity dropping to 7-17% in inland areas. West to northwest winds will gust to 25-30 mph from the Cascade-Sierra crest east, especially toward the Oregon state line. The north coast will also be dry with light offshore winds and poor overnight relative humidity (RH) recovery while a deeper marine layer keeps the Bay Area marine zone cool and humid. From Tuesday through Friday a weak trough will be over the region. Dry and warm weather will continue. Temperatures will continue around 2-5 degrees above normal, with low humidity both in the day and at night in inland areas. Light offshore winds will continue to keep the north coast areas very dry, while a better onshore flow keeps the Bay Area marine zone cool and humid. On Saturday the weak trough will move east, but little change is expected in weather conditions. A stronger system to our northwest beginning Sunday will cause increasing southwest flow over the region, and south to west winds gusting to 25-30 mph will combine with low RH to increase fire potential a bit. A deeper marine layer will move farther inland, and the north coast will benefit from the cool humid air, as well.

SOUTHERN CALIFORNIA

The low pressure area which triggered significant lightning activity yesterday is beginning to move east of the area. Yesterday, nearly 400 lightning strikes occurred in the Sierras with over 1,100 recorded across the entire district. Today, scattered thunderstorms will still be possible in the Sierras into the desert, but storms, and associated lightning, should be far less numerous. Most of the storms today should be focused on the Stanislaus, Sierra and Inyo National Forests as well as Yosemite National Park. Some light precipitation should accompany most of the storms, but a few strikes will still be possible this afternoon. Elsewhere, temperatures may warm up a degree or two with highs in the 70s along the coast, lower 90s in the valleys, 100 in the San Joaquin Valley to 110 in the desert. Minimum relative humidity (RH) will drop into the teens in desert adjacent areas of the mountains, but most other areas will be in the 20-25% range away from the coast. A cooler, drier pattern is expected the rest of the week as northerly flow aloft prevails through Friday. A few cumulus buildups will occur in the Sierras the next few days, but no further thunderstorm activity is expected after today. Highs will be a few degrees below normal through the end of the workweek with highs in the 80s in the valleys to 95 in the San Joaquin Valley. An increase in marine layer coverage will likely occur Wednesday through Friday, but stratus will likely stay out of the valleys most of the week. It will turn breezy in and near the Antelope Valley and Banning Pass where some gusts to 30 mph will be possible each afternoon. Expect afternoon RH to be a bit lower toward the weekend with some areas dropping into the 10-15% range by Friday. A high pressure ridge will build over the region early next week, bringing warmer and less windy weather. No further thunderstorm activity is expected during the period.
